Monitoring FMCSA Progress: Compliance, Safety, Accountability (CSA) and Intervention Effectiveness Models

2015 Transportation Research Board 94th Annual Meeting
Federal Motor Carrier Safety Administration
Analysis, Research, and Technology Forum
January 13, 2015
SAFETY MEASUREMENT SYSTEM EFFECTIVENESS
Safety Measurement System (SMS)

- FMCSA prioritizes companies when a pattern of non-compliance is present due to the increased crash risk.
- SMS is not designed nor intended to predict an individual company’s crashes in the future.
- Patterns of non-compliance (Behavioral Analysis and Safety Improvement Categories, or BASICs) relate to a higher future crash rate for groups of carriers.
Objective—Quantify how effectively SMS identifies high-risk motor carriers.

Methodology—Use historical data to examine the “future” crash rate of motor carriers.

Consistent with findings of analysis by University of Michigan Transportation Research Institute and the American Transportation Research Institute.
Prioritized Companies: By Carrier Size

- Higher crash rates are observed, regardless of carrier size.
- FMCSA is more selective and more effective when prioritizing smaller carriers:
  - 12% of small carriers are prioritized.
  - Crash rates are 137% higher than those not prioritized.
SMS is prioritizing carriers with higher crash rates than active carriers not prioritized:

- Carriers prioritized in one or more BASICs have crash rates 79% higher:
  - 4.82 crashes per 100 power units compared to 2.69 for carriers not identified.
- High-risk carriers have a crash rate twice the national average.
  - 7.33 crashes per 100 power units compared to 3.43.

Crash Rates by BASIC

Six of the seven BASICs show that prioritized carriers have a crash rate higher than the national average.

For-hire operators of combination units:
All seven BASICs have a crash rate higher than the national average and are about half of the carriers assessed.
